Your submission	Obviously a great deal of research has been gone into fairly apportioning the cost of flood control. Has their been any study commissioned or completed on the feasibility of moderating the extremes of the river flow by damming the tributaries, and thus maintaining river flows in times of drought, mitigating the damaging effect of high river flows? This could provide irrigation and recreational benefits and also save the costs involved in damage repair.
What do you want Environment Canterbury to do?	Confirm if, or if not this has been seriously considered, and if not why not
